## LAB 4

Lab Title: JDBC SELECT Query Execution.

### Objective:

To execute a SELECT query execution using JDBC.

### Theory:

JDBC connects Java applications with databases. It uses DriverManager, Connection, Statement, and ResultSet. Exceptions are handled using try-catch blocks.

### Program Code:

```
import java.sql.* ;

class JdbcSelect {
    public static void main (String[] args) {
        try {
            Connection con = DriverManager.getConnection (
                "jdbc:mysql://localhost:3306/testdb", "pookie", "");
            Statement st = con.createStatement();
            ResultSet rs = st.executeQuery ("SELECT * FROM student");
            while (rs.next()) {
                System.out.println (rs.getInt(1) + " " + rs.getString(2));
            }
            con.close();
        } catch (Exception e) {
            System.out.println (e);
        }
    }
}
```

### Conclusion:

JDBC allows Java programs to interact with databases. SELECT queries retrieve data using Resultset.
